DeltaOps Learning

PARTNER GUIDE

AI learning labs your team can run

Safe, guided labs that help children understand how AI responds to instructions, led by the staff who know them best.

AT A GLANCE

A practical, safe way to explore AI with children.

DeltaOps Learning creates browser-based labs for organisations that work with children. Children choose from prepared instruction cards, see how an AI-style helper responds, talk through the result and decide what to try next.

IN THE LAB The helper assumes that everyone in Roman Londinium ate lavish feasts. The facilitator asks who really ate like this. Children compare the answer with the evidence.

WHO IT'S FOR

STEM and education providers, activity centres and camps, museums, and visitor or nature centres that run sessions for children.

WHAT CHILDREN DO

Take on a challenge, choose instruction cards, see what changes, then discuss and try a better option.

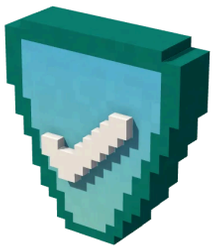

WHAT CHILDREN MAKE

Each lab ends with something children can keep or share, such as a habitat plan, rover specification or expedition map.

HOW IT RUNS

In a web browser, led by your staff. Before launch, we check the devices, session format and setting together.

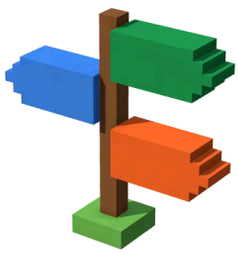

Designed for children. Straightforward for staff.

01

Safe to use

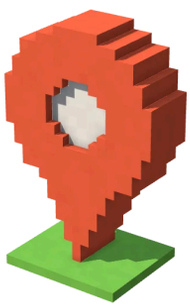

Children choose from prepared cards. Every response is written and tested in advance. There is no open chatbot, no free typing and no child account.

02

Easy to lead

Your staff run the session as they normally would. They do not need specialist AI knowledge: the lab gives them prompts for the next question.

03

Made for your setting

We shape the topic, story and final activity around your children, your venue and what you want them to learn.

We are developing these labs with partners. Before a pilot, we agree the session plan, safeguarding, data handling and technical set-up.

HOW IT WORKS

Make a choice.
See the result. Try again.

Every lab follows the same four-step loop. This example is Eco AI Explorer, a demonstration lab for a nature centre.

1

SET THE CHALLENGE

Mission

Plan a pond that works for visitors and wildlife. The cards let children describe how they want their world transformed.

2

CHOOSE AN INSTRUCTION

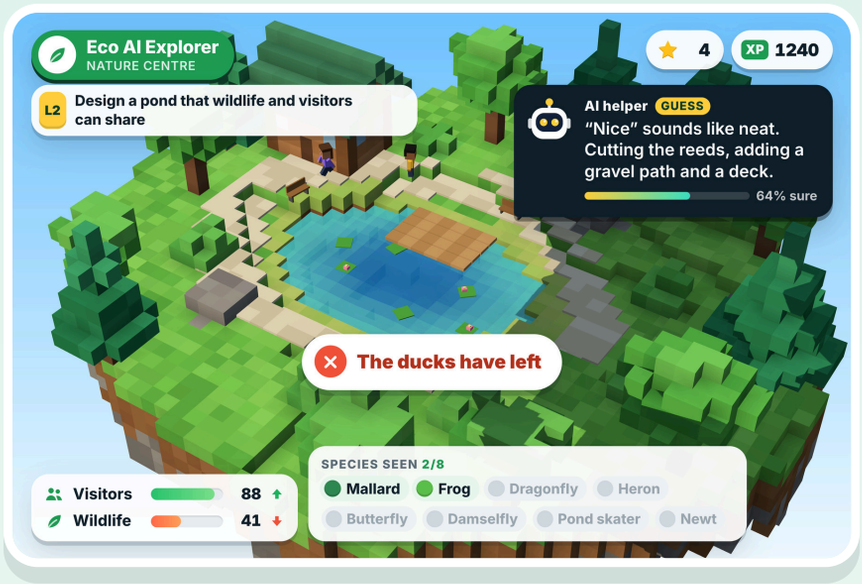

Choice

A child selects: “Make it nice for visitors.” The helper has to work out what “nice” means, and reveals the assumption it has made.

WHAT CHILDREN PRACTISE

Set a goal | Give clear instructions | Notice assumptions | Question a response | Test options | Explain a choice

3

SEE THE RESULT

Consequence

The helper removes the reeds and adds a gravel path. Visitors have more space, but wildlife loses habitat and the ducks leave.

4

IMPROVE THE INSTRUCTION

Try again

An on-screen prompt helps the facilitator ask what went wrong. The child chooses a clearer instruction: “Add a boardwalk and keep the reeds wild.”

THE RESULT

A better choice

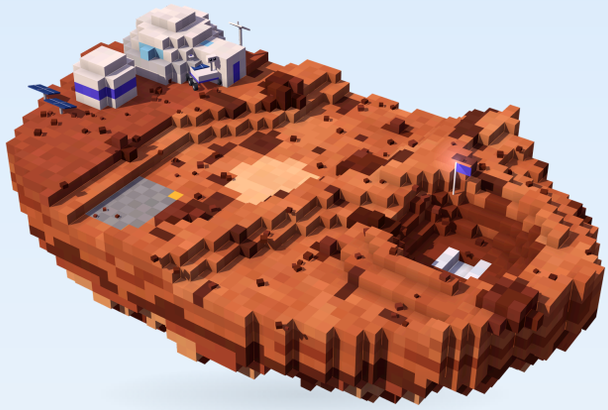

The reeds stay. Wildlife returns. The child saves the habitat plan and explains why this choice worked better.

This is a demonstration running on our lab engine. The helper uses prepared responses rather than a live AI model.

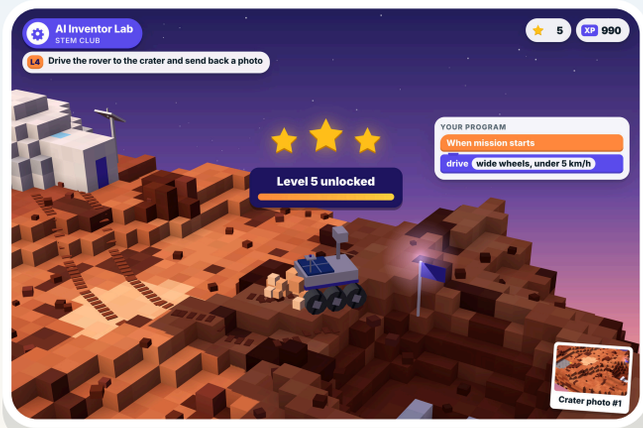

EXAMPLES

One lab system.
Different local stories.

FOR A NATURE CENTRE

Eco AI Explorer

Children plan a pond. A vague instruction leads to a path through the reeds. A clearer instruction protects space for wildlife and visitors.

RUNS AS	A habitat activity for school visits
CHILDREN MAKE	A habitat plan

FOR A STEM PROVIDER

AI Inventor Lab

Children program a rover, improve their instructions, test it on sand and compare what its camera reports with what they can see.

RUNS AS	A licensed module for clubs and classrooms
CHILDREN MAKE	A rover specification

THE SAME IN EVERY LAB

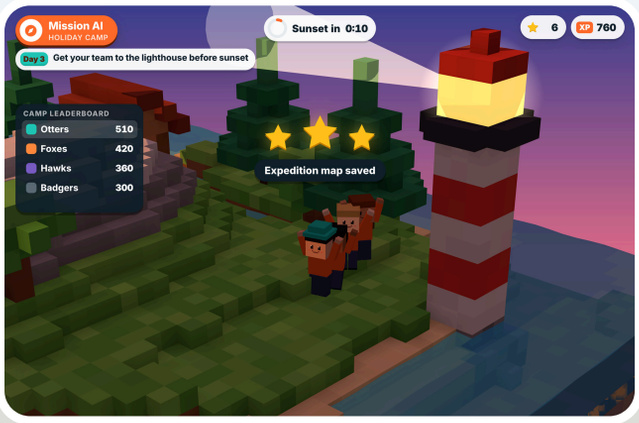

- How children make choices
- Safety controls
- The lab engine

ADAPTED FOR YOUR SETTING

- The story
- The challenges
- What children make

FOR AN ACTIVITY CENTRE

Mission AI

Teams choose a route before sunset. They see what the helper assumed, rethink the plan and decide what to do next.

RUNS AS	A timed team challenge led by a trained facilitator
CHILDREN MAKE	An expedition map

FOR A MUSEUM OR VISITOR CENTRE

AI Time Traveller

Children compare the helper's version of the past with objects and evidence from your own collection.

RUNS AS	A collection-based mission for school visits and family days
CHILDREN MAKE	A traveller's diary

Children can select from six different AI labs.

All use the same lab system.

ENERGY

Eco Town

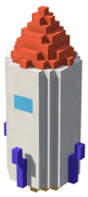

WATER

River Town

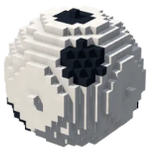

FOOD

Grow Lab

SPACE

Moon Base

SPORT

Kick Lab

MUSIC

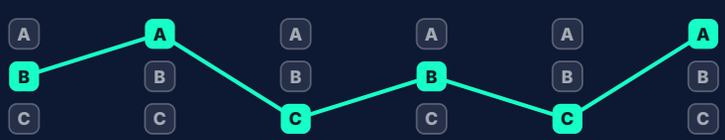

Beat Lab

729

POSSIBLE ROUTES THROUGH EACH LAB

Each lab has six stages, with three cards to choose from at each stage. That gives children many ways through the story, rather than one “correct” answer.

At every stage, at least one card is deliberately unclear. Children can see how vague instructions affect the result.

Everything needed to deliver a first session.

We provide the lab, the learning design and staff preparation. You bring your knowledge of the children, venue and programme.

Ready-to-use labs

Choose a starting point from our library: energy, water, food, space, sport or music.

Lab and learning design

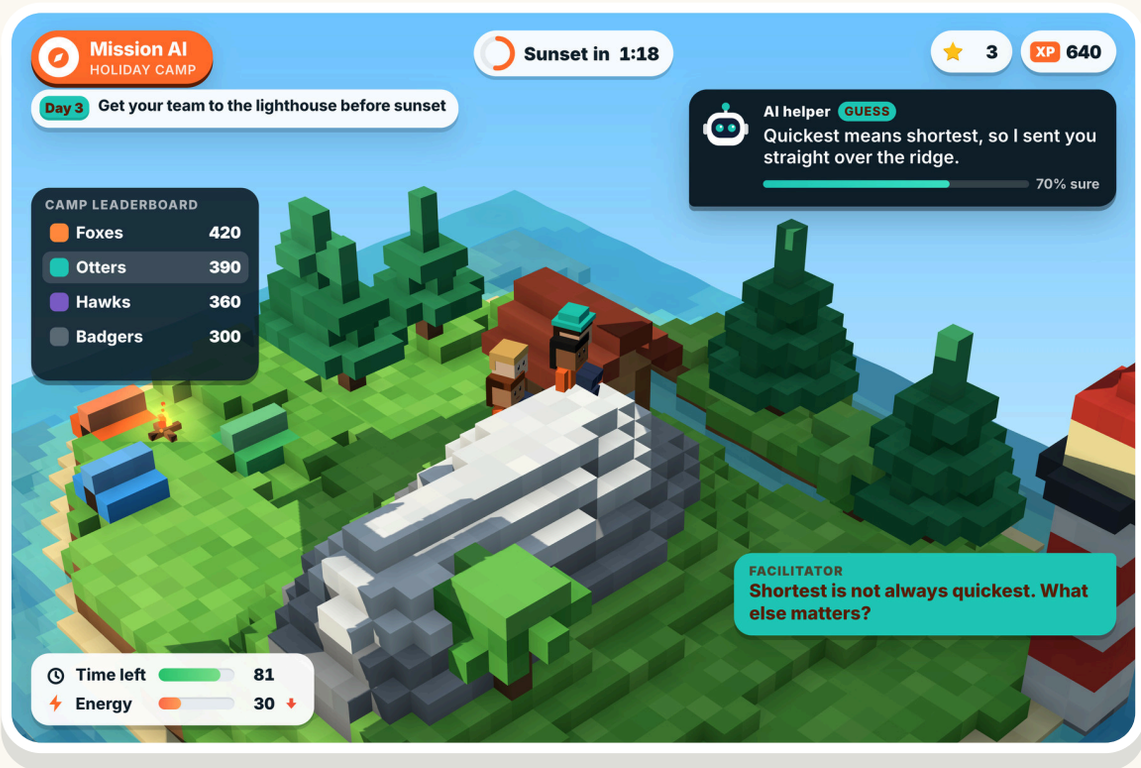

We adapt the missions, choices and final activity to your topic and learning goals.

Facilitator guide and training

Your team receives session plans, on-screen questions and a practice session.

Set-up and support

We check devices before launch, then use what we learn from sessions to improve the lab.

IN THE LAB The lab tells the facilitator when it is useful to pause and ask a question.

Build it together.
Try it with one group.
Decide what comes next.

1

Design together

We plan one experience around your group, setting and learning goals.

2

Pilot

Your staff run it with a first group. Together, we review what worked and what needs changing.

3

Expand

We improve the lab, then support you to use it more widely if the pilot shows it is worthwhile.

What we agree before the first session

We agree these practical details so the pilot fits your setting.

1. **Who takes part**
   Ages, group sizes and who leads each session.
2. **Where it runs**
   Your venue, devices and network.
3. **How it fits**
   Session length and where it sits in your existing programme.
4. **Safeguarding and data**
   How children are supported and what information, if any, is stored.
5. **Training**
   What your team needs before the first session.
6. **Success**
   What a useful pilot looks like and how we will assess it together.

Built by people who design practical AI training.

DeltaOps helps organisations use AI and automation responsibly. DeltaOps Learning applies that experience to children's learning through guided, discussion-based labs.

Arpan Bakshi

Co-founder, DeltaOps Learning

Parent of two and co-founder of an AI training firm. Arpan has led teams in sustainable design and strategy, including at Foster + Partners.

- Anthropic certified

Oliver Ramirez

Co-founder and CEO, DeltaOps

Oliver has worked across Amazon Prime Video, Henkel and DeltaOps. He has led automation projects that have saved clients thousands of hours of manual work.

- Google AI and Anthropic certified

DELTAOPS EXPERIENCE

250+

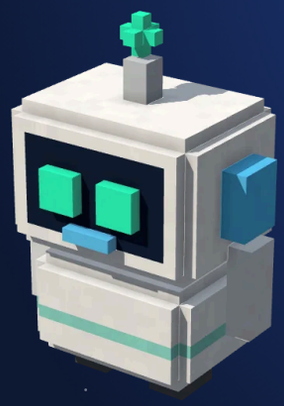

business leaders trained to use AI at work

100+

hours of manual work automated each week for a content agency

25+

children's activity providers enrolled in the pilot programme
